

SAVANNA TRAILS

Africa is the mother continent - the core from which all the other continents were torn away 270 million years ago. Since then, three factors have had profound consequences on its wildlife. This mighty block of land has stayed in much the same place, it stands alone and it straddles the equator. It's also been protected from crippling ice ages and destructive invasions as well as nurtured by gentle changes in climate and geology. As a result, animals and plants have flourished here more successfully than on any other continent. This is Africa - rich, diverse and fascinating - and at the heart of the world.

Influenced by climate and geology, time has allowed Africa to accumulate the breathtaking variety of wildlife we see today. Our trails take through this fascinating beautiful ancient landscape

The East African savanna, dry tropical grassland, is home to a rich array of spectacular animals. Predators like lions and cheetahs prey on grazing and browsing animals like zebras and gazelles. Stately birds like kori bustards stalk smaller prey while rarely seen naked mole-rats inhabit burrows on the savanna. You can see these species when you travel to Africa. Just book with Heritage Africa Trails

We organize for groups and individual travelers this includes transport arrangement accommodation and guides plus all information regarding park fees and regulations.

For more info you can Email us to send you detailed information regarding your destinations.

We cover most of East Africa which includes Kenya, Uganda Congo Tanzania, Rwanda and Malawi
